

Meshy Extension: 23/10/2025

Today, continuing from the last session, we began debugging the issue of our models not being displayed for their corresponding images. We made a huge overhaul of where our scripts were placed and moved everything into an empty GameObject called “Services.”

Once the overhaul was complete, we had a much better overview of all our active scripts.

Next, we looked into the **GltfLoader.cs** class and utilized GitHub Copilot to figure out why our 3D models weren't showing up. After a lot of changes and testing, we discovered that the issue was due to using an outdated version of the **Unity glTFast** library. Once we updated the package and adjusted some deprecated code, we finally got the models to appear above their linked images.

This was great progress, but then we encountered another issue — our models weren't textured and appeared purple, which typically indicates missing textures. First, we double-checked our API call and confirmed that the parameter “**should_texture**” was set to **true** in **MeshyClient.cs**. Moving on, we returned to **GltfLoader.cs**, where the agent suggested several ways to fix the issue.

The first suggestion was to add specific shader names, such as “**Universal Render Pipeline**”, to the “**Always Include**” section to ensure that our Android build included them, which in turn should have resolved the texture problem.

However, nothing changed.

The second suggestion was to create our own custom render instance, which we would later hook up in the **Quality** settings under each preset: **Performant**, **Balanced**, and **High Fidelity**.

We've come to terms with the fact that this part of the project might ultimately remain unfinished, as we've now shifted our focus toward the VR project. Kim will continue working primarily on getting this aspect of the AR project to function, in addition to writing the dev blog documenting each attempt. The rest of the group will focus exclusively on the VR section. Next time, when we resume work on the VR project, Kim will do his best to bring the AR project to a presentable state.
