

Baseline Foundation: 25/09/2025

Today we continued refining our project to match the given requirements of eventually displaying 3D models and playing sounds for images from a picture or fantasy book.

First, we started by cleaning up and removing elements that weren't being used, such as default templates that interfered with the display of our Android build.

We removed unnecessary template components such as:

- **AR Plane Manager** (plane detection, not needed)
- **AR Point Cloud Manager** (debug feature points)
- **AR Anchor Manager** (persistent anchors, unused)
- **AR Raycast Manager** (tap-to-place, not required)
- **AR Occlusion Manager** (depth/occlusion effects)
- **Placement Indicator prefab** (demo placement object)
- **Debug UI canvases and sample scripts** (tracking state overlays, demo code)

Once everything was cleaned up, we ran a few test builds because we had issues with the orientation of the displayed 3D animal. The animal always appeared with its back facing us whenever we scanned an image. After some research and help from our teacher, we figured out that we needed a parent GameObject. By making the 3D model a child of this parent, we could rotate the parent to adjust the orientation of the model, ensuring it displayed correctly in our Android build.

After resolving the orientation issue, we began adding sound effects. These sounds were not created by us but were downloaded for free, just like the 3D animal models used in this project. We used a **Collider Component** and adjusted its size to fit the 3D model. Next, we added an **Audio Source Component** and attached the downloaded audio file for that animal. Finally, we added an **Event Trigger Component** and set up the OnPointerClick() event to play the Audio Source whenever the model was tapped.

Surprisingly, this setup was quick and easy, and it didn't take long before we had a working build. We also discussed the possibility of adding more requirements, since at this pace our project would be completed too soon. We agreed that in our next meeting we would review the remaining todos and add additional requirements, such as creating our own 3D models in Blender or adding more interactive elements to the picture/fantasy book experience.

Overall, the morale of the group is great, and everyone is aligned on the direction the project should take. Moving forward, we are considering scrapping the idea of each member having their own scene, as our current collaboration style has proven effective enough to propel the project this far.
